Pseudocode (compute_offset)

```
compute_offset(month, year)
    # Root day is January 1, 1973 (Monday), calculate based on that
    total_days ← 0
```

```

# Add days for all past years
FOR y ← 1973 ... year
    IF is_leap_year(y)
        total_days ← total_days + 366
    ELSE
        total_days ← total_days + 365

# Add days for months
FOR m ← 1 ... month
    total_days ← total_days + number_days_in_month(m, year)

# Return 0-6 (0 = Monday, 6 = Saturday)
RETURN total_days % 7

```
